ALMA MATER STUDIORUM · UNIVERSITÀ DI BOLOGNA

SCUOLA DI SCIENZE

Corso di Laurea in Informatica

An Updated Emulated Architecture to Support the Study of Operating Systems

Relatore:
Prof. Renzo Davoli

Presentata da:
Mattia Biondi

Correlatore:
Prof. Michael Goldweber

Sessione III
Anno Accademico 2018/2019

Agli amici di sempre,
alla mia famiglia,
che non mi ha mai impedito nulla,
e a Jas,
senza la quale non sarei qui oggi.

Abstract

One of the most effective way to learn something new is by actively practicing it, and there is—maybe—no better way to study an Operating Systems course than by building your own OS. It is also true that the realization of an operating system capable of running on a real hardware machine could be an overly complex and unsuitable task for an undergraduated student. Nonetheless, it is possibile to use simplified computer system simulators in order to achieve the goal of teaching Computer Science foundations in the university environment, thus allowing students to experience a quite realistic rappresentation of an operating system. μMPS [1] has been created for this purpose, a pedagogically appropriate machine emulator, based aroud the MIPS R2/3000 microprocessor, which features an accessible architecture that includes a rich set of easily programmable devices. μMPS has an almost two decades old historical development and the outcome of the following thesis is the third version of the software, dubbed μMPS3. This second major revision aims to semplify even more the emulator's complexity in order to lighten the load of work required by the students during the OS design and implementation. Two of these semplifications are the removal of the virtual memory bit, which allowed address translation to be turned on and off, and the replacement of the tape device with a new flash drive device—certainly something more familiar to the new generation of students. Other major improvements which concern everything from the project building tools to the front-end were made, enabling the upgrade of μMPS to a modern reliable educational software.

Contents

Chapter 1

Introduction

Chapter 2

TLB Floor Address

Chapter 3

BIOS data structures area

Chapter 4

VM bit removal

Chapter 5

Flash Device

Chapter 6

Project rebase

6.1   CMake

6.2   Qt5

Chapter 7

Debian packaging
